THREADED & BAYONET CONNECTORS FOR DEMANDING ENVIRONMENTS

CONNECTORS FOR DEMANDING ENVIRONMENTS

THREADED AND BAYONET

MILITARY AND COMMERCIAL AVIATION

This catalog defines rms MIL-DTL-26500, Series III Connectors. There are varieties of connectors within this cylindrical family, with the following options and characteristics available:

- » Two coupling styles: Bayonet and Threaded Plugs and Receptacles.
- » Both coupling styles inter-mate with MIL-DTL-83723 connectors (exception: shell size 8 threaded, does not mate with M83723 threaded).
- » Aluminum and passivated stainless steel versions.
- » A variety of mounting configurations.
- » A variety of material finishes are offered such as electroless nickel, olive drab cadmium and black anodizing. Other finishes are available with a commercial equivalent.
- » Alternate key/keyway positions prevent cross mating of adjacent connectors having the same insert arrangement.
- » Positive alignment of pin contacts by the lead in chamfers of the closed entry hard socket inserts, for select Boeing products.
- » The elastomer grommet is able to seal over a wide range of wire diameters and has a triple wire seal in each cavity.
- » The front release crimped contact retainer system features a retaining clip captivated by molded in shoulders of each contact cavity in the insulator. This produces a very stable contact.
- » Can be ordered by military, Boeing, or equivalent rms part numbers.

Should you require more information or have a special application need arise, please contact:

rms Connectors Overview

General Operating Features of Electrical Connectors from rms

This catalog describes several series of electrical connectors manufactured by rms that are either listed on QPL-26500 or are derivatives of MIL-DTL-26500.

Features of the connectors described include:

1. Meeting requirements of MIL-DTL-26500.
2. Contacts that are rear insertion/ front removable, front insertion/ front removable, and non-removable.
3. Connectors that utilize crimp contact, wire wrap, or soldering to flex circuitry and printed circuit boards.
4. Extreme vibration level exposure, bayonet and threaded coupling.
5. Self-locking threaded coupling connectors.

Contact Ordering Information

rms connectors may be ordered with or without contacts by using the order code included with the rms catalog part number.

Contacts included with the package are sufficient to complete the connector termination plus two (2) spares. When contacts are ordered, seal plugs are also included for use when no wire is terminated. Three (3) plugs minimum are included up to a maximum of 15% of contact holes.

General Performance Characteristics

Test Description	Test Requirement	Test Result
Maintenance Aging	Connectors shall be coupled and uncoupled 10 times. Minimum of 10 contacts removed and reinserted 10 times. Connectors shall meet requirements of all succeeding tests.	There was no observable damage. Connectors met or exceeded requirements of all succeeding tests.
Contact Retention	Axial loads (20 lbs.—size 20; 25 lbs.—size 16; 30 lbs.—size 12) shall be applied to the front and rear of individual contacts in unmated connectors. The rate of application shall be approximately one pound per second. Axial displacement shall be .012 inch maximum when the pressure is applied from the front side.	Maintains load after 10 cycles. Axial displacement was within requirements.
Dielectric Withstanding Voltage Altitude and Sea Level	Mated connectors shall be subjected to 1000 volts rms at altitudes up to 110,000 feet and 1500 volts rms at sea level. Unmated connectors shall be subjected to 250 volts rms at altitudes up to 110,000 feet and 1500 volts rms at sea level. There shall be no evidence of breakdown or flashover.	There was no evidence of breakdown or flashover.
Thermal Shock	Mated connectors shall be exposed for 30 minutes to each temperature from -55°C to +200°C. Transfers between temperatures begin at -55°C and are made within two minutes. There shall be no damage detrimental to connector operation.	After five cycles, there was no evidence of cracking, fracture, or other damage detrimental to connector operation.
Vibration	Completely wired and mated connectors shall be mounted on an appropriate fixture on a vibration table. All contacts shall be wired in series. Current level shall be 100 milliamperes. There shall be no continuity interruption longer than 1 microsecond, contact chatter, or physical damage to the connectors.	There was no intermittency or evidence of physical damage to the connector.
Durability	Connectors shall be mated and unmated 500 times (Bayonet) or 200 times (Threaded), without producing physical or electrical defects detrimental to operation. They shall meet requirements of Dielectric Withstanding Voltage test.	There was no damaged detrimental to connector operation. Dielectric Withstanding Voltage test was passed.
Corrosion	Unmated connectors shall be exposed to a salt spray for 48 hours without exposing base metal.	There was no exposure of base metal. Connector mated satisfactorily three times.
Ozone Exposure	Unmated connectors shall be exposed at room temperature to air containing a minimum ozone concentration of 0.01 to 0.05 percent by volume. There shall be no evidence of deterioration.	No damaged occurred to connector dielectric.
Insulation Resistance	As measured between five pairs of adjacent contacts and three contacts closest to the shell and the shell itself, insulation resistance shall be 5000 megohms minimum, measured after Maintenance Aging.	Insulation resistance was in excess of 5000 megohms.
Altitude Immersion	Mated connectors shall support 1500 volts rms submerged in salt water for 30 minutes while pressure is alternated between sea level and 75,000 feet altitude equivalents.	There was no flashover or breakdown. Insulation resistance requirement was checked and met or exceeded.
Temperature Life	Connectors shall carry specified current for 1000 hours with internal temperatures not to exceed 238°C.	Connectors carried specified current for 1000 hours.
Moisture Resistance	Per MIL-STD-202, method 106. Connectors shall maintain insulation resistance of 1000 megohms minimum.	Insulation resistance was greater than 1000 megohms.
Fluid Immersion	Unmated connectors shall be immersed in fluid (MIL-PRF-5606 hydraulic fluid or MIL-PRF-23699 lubrication oil) for 20 hours. They shall couple properly and support 1500 volts ac rms.	Immersed connectors mated and unmated properly and withstood 1500 volts ac (rms) applied with no flashover or leakage breakdown.

The R0716 Series connectors are qualified to, and meet, the requirements of MIL-DTL-26500 Class R, Type B; MS24266 Type B; and Boeing Standard BACC45FT.

The connector is bayonet coupled with rear insertion, front release contacts. The connector can be ordered either with or without gold plated contacts by using the order code associated with the rms number.

When ordering by the MS number, the connector is supplied with gold plated contacts. If the connector is to be ordered by the MS number, but the contacts are not required, use the phrase, "less contacts."

For contact, seal plug and tooling information, see page 4.

The R0718 Series connectors are qualified to, and meet the requirements of MIL-DTL-26500 Class R, Type T; MS24266 Type T; and Boeing Standard BACC45FS.

The connector is thread coupled with rear insertion, front release contacts. The connector may be ordered either with or without gold plated contacts by using the code associated with the rms number.

When ordering by the MS number, the connector is supplied with gold plated contacts. If the connector is to be ordered by the MS number, but the contacts are not required, use the phrase, "less contacts".

For contact, seal plug, and tooling information see page 4.

R0701

Fig. 1

Fig. 2

Fig. 3

Until the R0700, R0712 and R0701 Series, any severe vibration caused early failure in connectors, especially bayonet coupling types. The R0700 and R0712 Series, however, put an end to wear and controlled the relative motion between plug and receptacle.

Engineering Analysis

First, a detailed analysis on failure-prone connectors revealed that a “vibration envelope” induced forces on the connector. It was this “envelope” that resulted in wear and produced the relative motion between the plug and its mating receptacle.

Further study disclosed that this relative motion stemmed from the unloading effect on the clamping force when the bayonet dropped into its detent in the coupling ring ramp (See Figure 1).

Next, an examination of the vibration that caused connector failures indicated that the transmittal path was through the mounted receptacle into the mated plug (similar to the pivoting of a free half of hinge, as in Figure 2). When the vibration occurred, wear began at the hinge pivot,

ultimately wearing completely out. In addition to this hinge pivot wear, extreme mechanical wear was also seen to occur at the pivotal points between the connectors (See Figure 3). Electromechanical reliability rapidly degraded as a result, and useful life was shortened dramatically.

rms engineers then reasoned that a rigid bar should be able to eliminate the hinge and pivotal wear. In addition, clamping the two mated connectors together – so they act as one rigid unit – should result in the elimination of the pivotal wear stemming from vibration. They created the R0700 and R0712 Series.

The R0700, R0712/R0701 Series

The R0700 and R0712 coupling rings were designed without a detent at the end of the ramp to provide a full static-locking force. As a result, when the bayonet is advanced to the end of the ramp during coupling, the detent rollers simultaneously drop into detents in a separate spring-loaded detent ring, locking the bayonets in place. This ring was also keyed to the coupling ring (See Figure 4).

Test Data

(Vibration)

Design Features

- A. Retainer
- B. Preload Spring
- C. Spacer
- D. Detent Spring
- E. Detent Ring
- F. Roller Feature

Fig. 4

Fig. 5

The locking mechanism itself (Figure 5) is retained by the retainer (A). This ring is adjusted and locked at final assembly to tune out all manufacturing tolerances. This procedure applies a predetermined locking force (pre-load) through a special pre-load member (B), and around the detent locking mechanism (C) directly against the bottoming flange (D) of the connector.

The result: a connector with maximum pre-load locking force that prevents unintentional loosening. In short, a vibration proof connector.

An R0700 and R0712 Series bayonet coupling connector acts like two connectors clamped together, or a threaded connector coupling mechanism (fully threaded) that provided a clamping pre-load and lock wired condition. The new design was the answer sought by users for a bayonet coupling convenience with screw type coupling rigidity. Plus, the R0700 and R0712 extended connector life over traditional models, cutting primary servicing time and costs. Downtime of equipment was drastically reduced.

rms R0700 and R0712 Series Connectors also:

- Mate with standard R0701, MIL-DTL-26500 and MIL-DTL-83723* bayonet receptacles presently used on aircraft.
- Use standard contacts, crimping, insertion, and removal tools.

Most important, the rms R0700 and R0712 withstands vibration and shock equivalent to the capability of thread-coupled connectors locked up metal-to-metal.

Materials

Materials used in the connectors are as specified in MIL-DTL-26500.

Finishes

Component finish and identification marking is in accordance with applicable requirements of MIL-DTL-26500 and tables.

Quality Assurance Provision

Mechanical, electrical and environmental performance complies with requirements of MIL-DTL-26500 for Type B, Class R connector plugs except as noted. Final acceptance of connector conforms to the "Quality Conformance Inspection" section of MIL-DTL-26500 except as noted.

**For specific intermatability information consult factory.*

Test Data

(Vibration)

Mounting

The plug connector was mated to a corresponding receptacle which was mounted by its normal mounting means to a suitable vibration fixture. The mated pair was wired in a manner that allowed a test current of 100ma in each contact. The resulting wire bundle was then clamped to the test table at a distance of 6 ± 1 inches from the rear of the wire sealing grommet. The connector plug was equipped with a cable clamp.

Testing

The test specimens were subjected to the random vibration motion specified in the figure on this page. Duration of the vibration was eight (8) hours in each of two mutually perpendicular axis, one of which was the major axis of the connector. For the R0700 series, three cycles of vibration were performed. A test current of 100ma was applied throughout the duration of the test. The maximum allowable current interruption (discontinuities) was one microsecond.

Acceptance

The connectors remained coupled throughout the test and exhibited no discontinuity greater than one microsecond. Visual examination revealed no wear of the normal mating surface as a result of the vibration (coupling rings, detents, keys, keyways, and bottoming contact surfaces).

About the Power Spectral Density Test Curve and the R0700, R0712/R0701 Series

The curve depicted represents a practical compromise between projected accelerated life tests (based on realistic operational aircraft vibration frequencies) and amplitudes elevated to practical test equipment capability levels. This means that the "time in test" factor can be adjusted to project operational life expectancy on any application where dynamic data has been established.

rms R0700 and R0701 connector test samples subjected to this test curve showed no evidence of wear or deterioration after vibrating for the hours specified (Total: 48 hours). Conventional connectors had worn out and failed at about 12 percent (4 hours) of the required test time.

rms R0712 connector test samples subjected to this test curve showed no evidence of wear or deterioration after vibrating for the number of hours specified (Total: 16 hours). Conventional connectors had worn out and failed at about 25 percent (4 hours) of the required test time.

R0710 Series

Threaded Plug Self-Locking

The R0710 Series of connectors meets the performance requirements of MIL-DTL-26500 Type T connectors.

The R0710 Series Connectors

The R0710 Series is a plug with thread-type coupling designed to intermate with the R0711 Series receptacle as well as MIL-DTL-26500 Type T, Class R connectors and other connectors with proprietary part numbers.

In addition to meeting the requirements of MIL-DTL-26500 Type T, Class R connectors, the following special features have been designed into the connectors to improve performance and user convenience:

1. Metal shell materials include aluminum, with a variety of conductive and non-conductive finishes, and stainless steel for extremely harsh environments.
2. Plug connectors are available with or without ground springs.
3. The plug connector includes self-locking coupling features to eliminate the need for safety wires.
4. The grommets are manufactured using a high-grade fluorosilicone elastomer material which increases the resistance to various oils and fuels.
5. The rear end geometry has been modified to accept non-rotatable rear hardware with accessory teeth per MS3155.
6. The connectors have design features that greatly improve the vibration resistance. (See Vibration Test Data.)
7. The plug connector coupling ring is attached to the shell by means of an rms patented fail-safe mechanism.

The R0710 Series connectors meet the performance requirements of MIL-DTL-2650 Class R, Type T; MS24266 Type T; and Boeing Standard BACC63BP.

The connector is thread coupled with rear insertion, front release contacts. The connector can be ordered either with or without gold plated contacts by using the order code associated with the rms number.

For contact, seal plug, and tooling information see page 4.

Insert Arrangement See Page 5

Class A Hard anodized aluminum shell and coupling ring, color black with fluorosilicone insert and grommet material. Qualified to BACC63BP for those insert arrangements that have no size 20 contacts.

Class B Passivated stainless steel shell and coupling ring with fluorosilicone insert and grommet material. Qualified to BACC63BP for those insert arrangements that have no size 20 contacts.

Class C Cadmium with clear chromate conversion over electroless nickel plated aluminum shell with fluorosilicone insert and grommet material. The shell has a ground spring. The coupling ring shall be hard anodized, color black. Qualified to BACC63BP for those insert arrangements that have no size 20 contacts.

Class D Passivated stainless steel shell and coupling ring with fluorosilicone insert and grommet material. The shell has a ground spring. Qualified to BACC63BP for those insert arrangements that have no size 20 contacts.

Class E Hard anodized aluminum shell and coupling ring, color black. Connectors have fluorosilicone insert and grommet material. Socket style connectors have a hard face socket insert. Qualified to BACC63BP for those insert arrangements that have size 20 contacts.

Class F Passivated stainless steel shell and coupling ring. Connectors have fluorosilicone insert and grommet material. Socket style connectors have a hard face socket insert. Qualified to BACC63BP for those insert arrangements that have size 20 contacts.

Class G Cadmium with clear chromate conversion over electroless nickel plated aluminum shell. The shell has a ground spring. The coupling ring shall be hard anodized, color black. Connectors have fluorosilicone insert and grommet material. Qualified to BACC63BP for those insert arrangements that have size 20 contacts.

Class H Passivated stainless steel shell and coupling ring. The shell has a ground spring. Connectors have fluorosilicone insert and grommet material. Qualified to BACC63BP for those insert arrangements that have size 20 contacts.

Class J Cadmium with clear chromate conversion over electroless nickel plated aluminum shell. The shell has a ground spring. The coupling ring shall be hard anodized, color black. Connectors have fluorosilicone insert and EPDM grommet material. Temperature exposure shall be 125° C max. Consult factory for availability.

Class L Hard anodized aluminum shell and coupling ring, color black. Connectors have fluorosilicone insert and EPDM grommet material. Temperature exposure shall be 125° C max. Consult factory for availability.

Class N Electroless nickel plated aluminum shell. The shell has a ground spring. The coupling ring shall be hard anodized, color black. Connectors have fluorosilicone insert and grommet material. Consult factory for availability.

Class W Cadmium with olive drab chromate conversion over electroless nickel plated aluminum shell with fluorosilicone insert and grommet material. The shell has a ground spring. The coupling ring shall be hard anodized, color black. Consult factory for availability.

Test Data

(Vibration)

Mounting

The plug connector was mated to a corresponding receptacle which was mounted by its normal mounting means to a suitable vibration fixture. The mated pair was wired in a manner that allowed a test current of 100ma in each contact. The resulting wire bundle was then clamped to the test table at a distance of 6 ± 1 inches from the rear of the wire sealing grommet. The connector plug was equipped with a cable clamp.

Testing

The test specimens were subjected to the random vibration motion specified in the figure on this page. Duration of the vibration was eight (8) hours in each of two mutually perpendicular axis, one of which was the major axis of the connector. A test current of 100ma was applied throughout the duration of the test. The maximum allowable current interruption (discontinuities) was one microsecond.

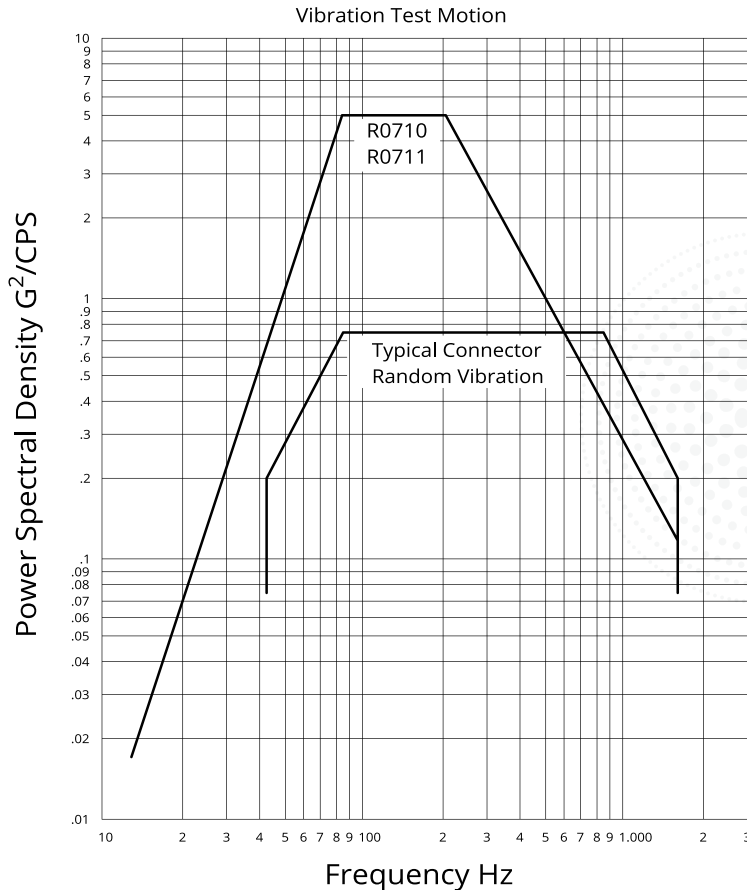

Acceptance

The connectors remained coupled throughout the test and exhibited no discontinuity greater than one microsecond. Visual examination revealed no wear of the normal mating surface as a result of the vibration (coupling rings, detents, keys, keyways, and bottoming contact surfaces).

About the Power Spectral Density Test Curve and the R0710/R0711 Series

The curve depicted represents a practical compromise between projected accelerated life tests (based on realistic operational aircraft vibration frequencies) and amplitudes elevated to practical test equipment capability levels. This means that "time in test" factor can be adjusted to project operational life expectancy on any application where dynamic data has been established.

rms R0710 and R0711 connector test samples subjected to this test curve showed no evidence of wear or deterioration after vibrating for the hours specified (Total: 16 hours).

R0713 Series

Flange Mount or Single Hole Mount Receptacles

Receptacles

The R0713 Series connectors are designed for termination to printed circuit boards, flex circuitry, or may be furnished with wire wrap or solder pot contacts.

The mating interface is compatible with MIL-DTL-26500 and MIL-DTL-83723/75, /76, /77, & /78 Type B Connectors. There are several mounting Flange variations as well as contact termination lengths as shown in the following figures. Consult factory for availability.

R0714 Series

Flange Mount

Receptacles

The R0714 Series connectors are designed for termination to printed circuit boards, flex circuitry, or may be furnished with solder pin contacts.

The gold plated contacts are designed for ease of maintenance with insertion and removal accomplished through the front side of the connector eliminating the requirement to disassemble the entire connector from its mounting. The mating interface is compatible with MIL-DTL-26500 and MIL-DTL-83723/75, 176, 177, & 178 Type B Connectors. There are several mounting Flange variations as well as contact termination lengths as shown in the following figures. Consult factory for availability.

Square Flange Bayonet or Threaded Receptacle

Receptacles

The R0715 Series connectors are used in areas where space within an electrical box or device is limited. The flange has been moved to the rear. There are no provisions for rear accessory hardware.

The connectors meet the performance requirements of MIL-DTL-26500 Type B or T, Class R. They are designed to mate with standard MIL-DTL-26500 connectors or derivatives of MIL-DTL-26500.

 T - Threaded Coupling

Class A Hard anodized aluminum shell, color black.

Class G Cadmium with clear chromate conversion over electroless nickel plated aluminum shell.

Class N Electroless nickel plated aluminum shell.

Class W Cadmium with olive drab chromate conversion over electroless nickel plated aluminum shell.

Class S Passivated stainless steel shell.

Shell Size 8, 10, 12, 14, 16, 18, 20, 22, 24

Series Designation Connector, Receptacle, Special Flange Mount

Threaded Plug Self-locking

R0726XXXXXX

The R0726 Series connectors meet the performance requirements of MIL-DTL-2650 Class R, Type T; MS24266 Type T; and Boeing Standard BACC63DY.

The connector is thread coupled with rear insertion, front release contacts. The connector can be ordered either with or without gold plated contacts by using the order code associated with the rms number.

For contact, seal plug, and tooling information see page 4.

How to Order

rms Catalog Number

R0726 10 A 05 P N - 0 00

00 - Less Cable Clamp
01 - With Right Angle Cable Clamp
02 - With Straight Cable Clamp

0 - Less Contacts
2 - With Gold Plated Contacts

Shell Keyway Position N, 6, 7, 8, 9, or 10

Contact Style

P - Pin Contact
S - Socket Contact

Insert Arrangement See Page 5

Class A Hard anodized aluminum shell and coupling ring, color black. Connectors have fluorosilicone insert and EPDM grommet material. Socket style connectors have a hard face socket insert. Qualified to BACC63DY. Temperature exposure shall be 125° C maximum.

Class B Passivated stainless steel shell and coupling ring. The shell has a ground spring. Connectors have fluorosilicone insert and EPDM grommet material. Socket style connectors have a hard face socket insert. Qualified to BACC63DY. Temperature exposure shall be 125° C maximum.

Class C Cadmium with clear chromate conversion over electroless nickel plated aluminum shell. The shell has a ground spring. The coupling ring shall be hard anodized, color black. Connectors have fluorosilicone insert and EPDM grommet material. Socket style connectors have a hard face socket insert. Qualified to BACC63DY. Temperature exposure shall be 125° C maximum.

Class W Cadmium with olive drab chromate conversion over electroless nickel plated aluminum shell. The shell has a ground spring. The coupling ring shall be hard anodized, color black. Connectors have fluorosilicone insert and EPDM grommet material. Socket style connectors have a hard face socket insert. Temperature exposure shall be 125° C maximum.

Shell Size 8, 10, 12, 14, 16, 18, 20, 22, 24, 28

General Information

Order Information:

To order any of the standard series of connectors listed in this catalog, or for information about custom designed connectors, contact the rms Sales office at:

A Cretex Aerospace Company
8600 Evergreen Boulevard
Minneapolis, Minnesota USA 55433-6036

Phone: (763) 786-1520
Toll-free: (800) 373-1520
E-mail: rmsconnectorscs@machine.com

Distribution

See rms website (www.rmsconnectors.com) for authorized distributors.

About rms

rms began operation in 1967 as a precision machining company that found its niche in the manufacture of complex, difficult and unusual parts and assemblies for the Medical, Computer, Defense and Aerospace industries.

Several years later, rms started to work with Boeing Commercial Airplane in the manufacture of critical application, high reliability electrical connects for the commercial aerospace industry. Precision machining and assembly required by the connector industry was a natural extension of rms' expertise in the machining of ultra-precision components.

Today, the rms Electrical Connector Division has over 100 standard series of connectors delivered world-wide. We take pride in manufacturing one of the highest quality electrical connectors on the market today. And we look forward to being at the leading edge of connector design and development in the many years to come.

Standard and Custom Design

This catalog was developed to introduce you to the entire series of the standard electrical connectors produced at rms. Our manufacturing facility is geared to meeting short lead-times and to providing quick delivery of your connectors.

For custom connectors, our engineering staff is highly experienced to assist you in the design and manufacture of non-standard items.

From concept to completion, rms has proven over and over that we're able to meet your critical requirements for any type of electrical connector desired.

Quality Assurance

rms' Quality Program is sophisticated and exacting; ISO 9001, AS9100, ISO 13485, FAA approved and FDA registered, designed to meet the most stringent needs of the Connector industry. Our objective is Zero Defects. From SPC to sophisticated electrical testing equipment, you can be assured that every connector you receive from rms has been manufactured and inspected to meet your standards...because first of all, they've met our standards.

Facilities

In early 1992, the company's 25th Anniversary year, rms moved to a newly constructed 80,000 square foot state-of-the-art facility which was designed and equipped to meet the exacting specifications for the connector industry. rms has continued to grow and today occupies over 210,000 ft² of manufacturing space. We are constantly adopting the latest technology and machining methods available to stay ahead of the intricate demands of the Aerospace industry.

World-Class Electrical Connectors From rms

Located in Minneapolis, Minnesota, rms has delivered quality electrical connectors to a wide range of customers world-wide. With fast turn-around and unbeatable service, we know you'll come to expect the best from rms.
