

## Dual-PLL Motherboard Frequency Generator

### Description

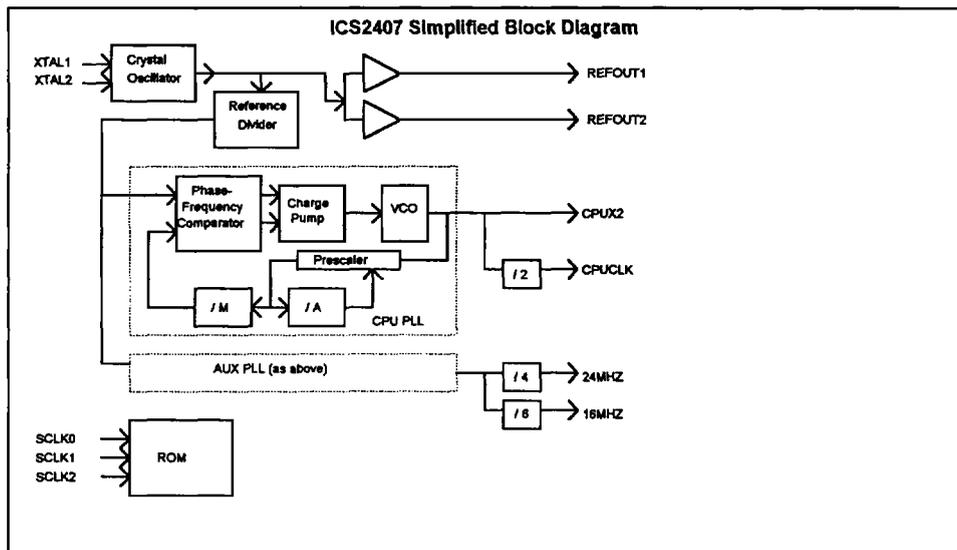

This ICS family of motherboard frequency generators all stem from the same basic design. They are dual-PLL (phase-locked loop) clock generators specifically designed for motherboard applications. Metal layer and assembly options are used to generate the three separate device types in order to optimize the functionality for specific applications. All frequencies are synthesized from a single reference clock which may be generated by the on-chip crystal oscillator or an external reference clock.

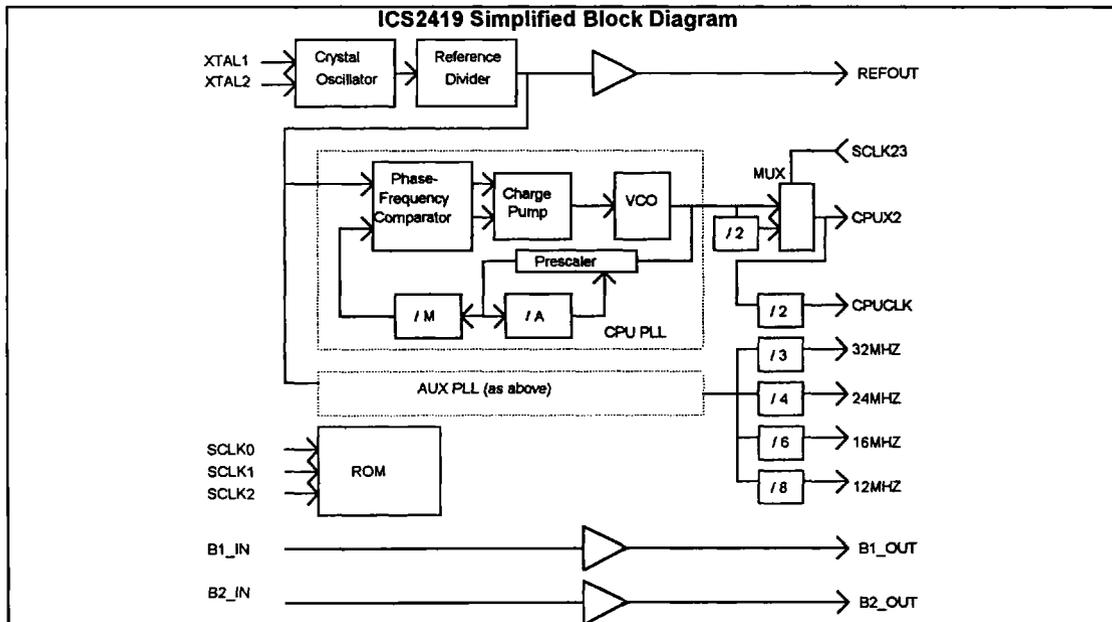

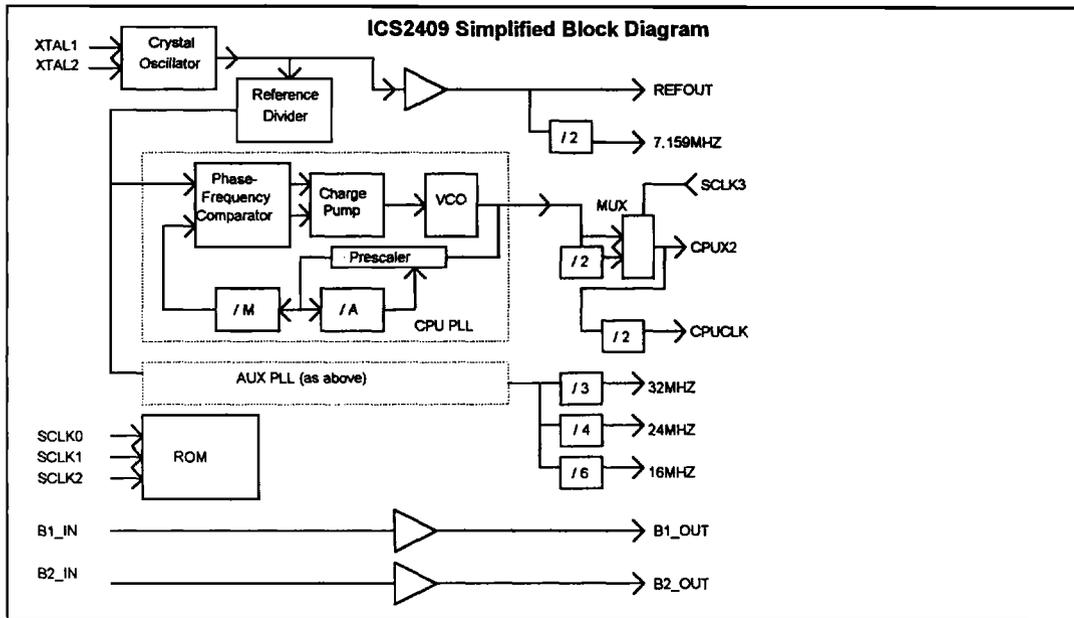

The CPU clock PLL is ROM-programmed to generate any of seven customer specified frequencies through selection of the address lines SCLK0-SCLK2. In the ICS2409, ICS2419 and ICS2439 versions the SCLK3 input selects those frequencies directly or divided by two for the CPUX2 output. The CPUX2 output is then divided by two to generate the CPULCK output. A power-down mode may be selected with the SCLK inputs to reduce standby current consumption to a few microamperes.

The auxiliary (AUX) PLL generates the fixed frequencies shown in Table 1 for other system uses. A buffered reference frequency output is available on the REFOUT pin. Two non-dedicated buffers are provided on the ICS2409, ICS2419 and ICS2439 for additional drive capability without adding external buffers and their board space.

### Features

- Supports 286, 386, & 486 desktop and notebook motherboard designs
- Advanced ICS monolithic phase-locked loop technology for low short-term and "cumulative" jitter
- Completely integrated - no external loop filter capacitors required
- Dual-modulus prescaler permits high-speed operation with no sacrifice in accuracy
- Power-down mode for low standby power consumption
- Low-skew between CPUX2 and CPULCK outputs (< 1 nsec)
- 3-volt supply capability to 85 MHz (CPUX2 output)
- Output enable (OE<sup>-</sup>) pin for tristate of device outputs
- ICS2409, ICS2419 and ICS2439 offer 24-pin PDIP (0.3") and 24-pin SSOP (5.3mm) package options
- ICS2407 offers 18-pin PDIP (0.3") and 18-pin SOIC (0.3") package options

## Circuit Function and Application

### Fixed Frequencies

The ICS motherboard family supplies "fixed" frequencies normally used to provide several system functions:

- 32 MHz - ISA Bus Clock
- 24 MHz - Floppy Drives
- 16 MHz - AT Bus Clock Output
- 12 MHz - Keyboard Clock
- 7.149 MHz - Keyboard Clock

### Selectable CPU Clock Frequencies

The **ICS2407**, **ICS2409**, **ICS2419** and **ICS2439** are designed to generate CPU clock options ranging from 24 MHz, to 88 MHz. For added flexibility, the **ICS2409**, **ICS2419** and **ICS2439** allow the user to select each of these frequencies divided by 2.

### Buffered Output Pins

In addition, the **ICS2409**, **ICS2419** and **ICS2439** provide 2 non-dedicated buffers for additional flexibility. This allows for extra drive capability without sacrificing the extra board space required for external buffers.

### Buffered XTALOUT

In motherboard applications it may be desirable to have the **ICS2439** provide the bus clock for the rest of the system. This eliminates the need for an additional 14.31818 MHz crystal oscillator on the system, saving money as well as board space. Depending on the load, it may be judicious to buffer REFOUT when using it to provide the system clock. On the **ICS2407**, there are two identical outputs, REFOUT1 and REFOUT2.

### Power-Down Mode

All three devices have been optimized for use in battery operated portables. It can be placed in a power-down mode which drops its supply current requirement below 1µA(typical).

## Pin Description

### Input Pins

#### Frequency Reference

The internal reference oscillator contains all of the passive components required. An appropriate crystal should be connected between XTAL1 (1) and XTAL2 (2). In IBM compatible applications this will typically be a 14.31818 MHz crystal.

#### Digital Inputs

SCLK0, SCLK1, SCLK2 and SCLK3 (**ICS2409**, **ICS2419** and **ICS2439** only) are the TTL compatible frequency select inputs for the binary code corresponding to the desired frequency. All select pins have internal pull-up devices built in (*See Table 2 for a complete list of available frequencies*).

#### Buffer Inputs (**ICS2409**, **ICS2419** & **ICS2439**)

B1\_IN and B2\_IN (3, 7) provide additional buffering needed on a typical board design without the added cost of external components.

#### Output Enable

An output enable pin OE~allows the user to tristate the device outputs. When this pin is high, all outputs are in tristate mode. When low, all outputs are enabled. This pin has an internal pull-down to enable all outputs when the pin is N/C.

| ICS2407 Pinout |         |         | ICS2409 Pinout |    |          | ICS2439 Pinout |    |    | ICS2419 Pinout |          |    |    |        |        |    |

## Absolute Maximum Ratings

|                        |                     |                          |
|------------------------|---------------------|--------------------------|
| Supply Voltage         | $V_{DD}$            | -0.5V to +7V             |
| Input Voltage          | $V_{IN}$            | -0.5V to $V_{DD} + 0.5V$ |
| Output Voltage         | $V_{OUT}$           | -0.5V to $V_{DD} + 0.5V$ |
| Clamp Diode Current    | $V_{IK}$ & $I_{OK}$ | $\pm 30mA$               |
| Output Current per Pin | $I_{OUT}$           | $\pm 50mA$               |
| Operating Temperature  | $T_O$               | 0°C to 70°               |
| Storage temperature    | $T_S$               | -85°C to 150°            |
| Power Dissipation      | $P_D$               | 500mW                    |

Values beyond these ratings may damage the device. This device contains circuitry to protect the inputs and outputs against damage due to high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid applications of any voltage higher than the maximum rated voltages. For proper operation it is recommended that  $V_{in}$  and  $V_{out}$  be constrained to  $\geq V_{SS}$  and  $\leq V_{DD}$ .

## DC Characteristics at 5 Volts $V_{DD}$

(0°C to +70°C)

## AC Timing Characteristics

The following notes apply to all of the parameters presented in this section.

1. REFCLK = 14.31818 MHz
2.  $t_c = 1/f_c$
3. All units are in nanoseconds (ns)
4. Rise and fall time between .8 and 2.0 V<sub>DX</sub> unless otherwise stated.
5. Output pin loading = 15pF
6. Duty cycle measured at V<sub>DD</sub>/2 unless otherwise stated.
