Adjustable precision shunt regulators

TL431C, TL431AC, TL431I, TL431AI, LM431AC

DESCRIPTION

The TL431 and TL431A are 3-terminal adjustable shunt regulators with specified thermal stability over applicable automotive and commercial temperature ranges. The output voltage may be set to any value between V_{REF} (approximately 2.5V) and 36V with two external resistors (see Figure 4). These devices have a typical output impedance of 0.2Ω. Active output circuitry provides a very sharp turn-on characteristic, making these devices excellent replacements for zener diodes in many applications like on-board regulation, adjustable power supplies and switching power supplies.

The TL431C and TL431AC are characterized for operation from 0°C to +70°C; the TL431I and TL431AI are characterized for operation from -40°C to +85°C.

FEATURES

- Equivalent full-range temperature coefficient: 30ppm/°C
- 0.2Ω typical output impedance
- Sink current capability: 1mA to 100mA
- Low output noise
- Adjustable output voltage: V_{REF} to 36V

NOTE:

1. SYMBOL INFORMATION: Parts will be marked with product name including temperature and electrical grade designators, but not the package identifier.
2. TO92 is normally shipped in bulk, i.e., in plastic bags (containing 1,000 parts), 5 bags per box. Tape and reel (or ammo box) is an option. See page 15 for information.

NOTES:

- Full temperature range is -40°C to +85°C for the TL431I and TL431AI, and 0°C to +70°C for the TL431C and TL431AC.
- The deviation parameters $V_{REF(dev)}$ and $I_{REF(dev)}$ are defined as the differences between the maximum and minimum values obtained over the rated temperature range. The average full-range temperature coefficient of the reference input voltage, αV_{REF} is defined as:

$$|\alpha V_{REF}| \left(\frac{\text{ppm}}{\text{deg C}} \right) = \frac{\left(\frac{V_{REF(dev)}}{V_{REF \text{ at } 25^\circ\text{C}}} \right) \cdot 10^6}{\Delta T_{amb}}$$

where ΔT_{amb} is the rated operating free-air temperature range of the device.

Adjustable precision shunt regulators

TL431C, TL431AC, TL431I, TL431AI, LM431AC

αV_{REF} can be positive or negative depending on whether minimum V_{REF} or maximum V_{REF} , respectively, occurs at the lower temperature.
 Example: Max $V_{REF} = 2496\text{mV}$ at 30°C , Min $V_{REF} = 2492\text{mV}$ at 0°C , $V_{REF} = 2495\text{mV}$ at 25°C , $\text{DTA} = 70^\circ\text{C}$ for TL431C.

$$|\alpha V_{REF}| = \frac{\left(\frac{4\text{mV}}{2495\text{mV}}\right) \cdot 10^6}{70^\circ\text{C}} = 23\text{ppm}/^\circ\text{C}$$

Because minimum V_{REF} occurs at the lower temperature, the coefficient is positive.

4. The dynamic impedance is defined as: $|Z_{KA}| = \frac{\Delta V_{KA}}{\Delta I_K}$

When the device is operating with two external resistors, (see Figure xx), the total dynamic impedance of the circuit is given by:

$$|Z'| = \frac{\Delta V}{\Delta I} \approx |Z_{KA}| \left(1 + \frac{R1}{R2}\right)$$
