

MAXIM

Single +5V, Fully Integrated, 155Mbps Laser Diode Driver

MAX3263

General Description

The MAX3263 is a complete, easy-to-program, single +5V-powered, 155Mbps laser diode driver with complementary enable inputs and automatic power control (APC). The MAX3263 accepts differential PECL inputs and provides complementary output currents. A temperature-stabilized reference voltage is provided to simplify laser current programming. This allows modulation current to be programmed up to 30mA and bias current to be programmed from up to 60mA with two external resistors.

An APC circuit is provided to maintain constant laser power in transmitters that use a monitor photodiode. Only two external resistors are required to implement the APC function.

The MAX3263's fully integrated feature set includes a TTL-compatible laser failure indicator and a programmable slow-start circuit to prevent laser damage. The slow-start is preset to 50ns and can be extended by adding an external capacitor.

Applications

Laser Diode Transmitters
155Mbps SDH/SONET
155Mbps ATM

Pin Configuration

Features

- ◆ Rise Times Less than 1ns
- ◆ Differential PECL Inputs
- ◆ Single +5V Supply
- ◆ Automatic Power Control
- ◆ Temperature-Compensated Reference Voltage
- ◆ Complementary Enable Inputs

Ordering Information

PART	TEMP. RANGE	PIN-PACKAGE

Single +5V, Fully Integrated, 155Mbps Laser Diode Driver

ABSOLUTE MAXIMUM RATINGS

Terminal Voltage (with respect to GND)	IPIN, IPINSET, OSADJ.....0mA to 2mA
Supply Voltages (V _{CCA} , V _{CCB}).....-0.3V to +6V	FAILOUT.....0mA to 10mA
VIN+, VIN-, FAILOUT.....0V to V _{CC}	IBIASFB.....-2mA to 2mA
OUT+, OUT-, IBIASOUT.....+1.5V to V _{CC}	Output Current
ENB+, ENB-.....V _{CC} or +5.5V, whichever is smaller	VREF1, VREF2.....0mA to 20mA
Differential Input Voltage (VIN+ - VIN-).....+3.8V	SLWSTRT.....0mA to 5mA
Input Current	Continuous Power Dissipation (T _A = +70°C)
IBIASOUT.....0mA to 75mA	SSOP (derate 8mW/°C above +70°C).....640mW
OUT+, OUT-.....0mA to 40mA	Operating Temperature Range.....0°C to +70°C
IBIASSET.....0mA to 1.875mA	Junction Temperature.....+150°C
IMODSET.....0mA to 2mA	Storage Temperature Range.....-55°C to +175°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC ELECTRICAL CHARACTERISTICS

(V_{CC} = V_{CCA} = V_{CCB} = +4.75V to +5.25V, T_A = 0°C to +70°C, unless otherwise noted. Typical values are at V_{CC} = +5V and T_A = +25°C.)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Range of Programmable Laser Bias Current	IBIAS				60	mA
Reference Voltage	VREF	T _A = +25°C	3.15	3.3	3.55	V
Available Reference Current	IREF			12		mA
Supply Current	I _{VCC}	(Note 1)			50	mA
PECL Input High	V _{IH}		V _{CC} - 1.165			V
PECL Input Low	V _{IL}			V _{CC} - 1.475		V
TTL High Input	V _{IH}		2		0.8	V
TTL Low Input	V _{IL}					V
FAILOUT Output High	V _{OH}	Loaded with 2.7kΩ pull-up resistor to V _{CC}	4.5			V
FAILOUT Output Low	V _{OL}	Loaded with 2.7kΩ pull-up resistor to V _{CC}			0.5	V

Note 1: I_{VCC} = I_{VCCA} + I_{VCCB}, I_{BIAS} = 60mA, I_{MOD} = 30mA, and I_{PIN} = 140μA.

AC ELECTRICAL CHARACTERISTICS

(V_{CC} = V_{CCA} = V_{CCB} = +4.75V to +5.25V, R_{LOAD} (at OUT+ and OUT-) = 25Ω connected to V_{CC}, T_A = 0°C to +70°C, unless otherwise noted. Typical values are at V_{CC} = +5V and T_A = +25°C.) (Note 2)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Range of Programmable Modulation Current	I _{MOD}	Minimum differential input swing is 1100mVp-p (Note 3)			30	mA
Modulation-Current Rise and Fall Time	t _R , t _F	IBIAS = 25mA, I _{MOD} = 12mA, 4ns unit interval; measured from 10% to 90%			1	ns
Aberrations, Rising and Falling Edge	OS	I _{MOD} = 12mA, T _A = +25°C		±15		%
Modulation-Current Pulse-Width Distortion	PWD	IBIAS = 25mA, I _{MOD} = 12mA, 8ns period			100	ps

Note 2: AC characteristics are guaranteed by design and characterization.

Note 3: An 1100mVp-p differential is equivalent to complementary 550mVp-p signals on VIN+ and VIN-.

Single +5V, Fully Integrated, 155Mbps Laser Diode Driver

Pin Description

PIN	NAME	FUNCTION
1	VREF2	Temperature-Compensated Reference Output. VREF2 is internally connected to VREF1.
2	IPINSET	Monitor Photodiode Programming Input. Connect IPINSET to VREF1 or VREF2 through a resistor to set the monitor current when using automatic power control (see <i>Typical Operating Characteristics</i>).
3	FAILOUT	Failout Output. Active-low, open-collector TTL output indicates if automatic power-control loop is out of regulation due to insufficient monitor-diode current (when VPIN is below the 2.6V threshold). Connect FAILOUT to VCC through a 2.7k Ω pull-up resistor.
4, 7	GNDB	Ground for Voltage Reference and Automatic Power-Control Circuitry
5	VIN+	Noninverting PECL Data Input
6	VIN-	Inverting PECL Data Input
8	VCCB	+5V Supply Voltage for Voltage Reference and Automatic Power-Control Circuitry. Connect VCCB to the same potential as VCCA, but provide separate bypassing for VCCA and VCCB.
9	ENB-	Inverting Enable TTL Input. Output currents are enabled only when ENB+ is high and ENB- is low.
10	ENB+	Noninverting Enable TTL Input. Output currents are enabled only when ENB+ is high and ENB- is low.
11	VREF1	Temperature-Compensated Reference Output. VREF1 is internally connected to VREF2.
12	OSADJ	Overshoot-Adjust Input. Connect to internal voltage reference through a resistor to adjust the overshoot of the modulation output signal (see <i>Typical Operating Characteristics</i>).
13	IBIASFB	Bias-Feedback Current Output. Output from automatic power-control circuit. Connect to IBIASSET when using APC.
14	IBIASSET	Laser Bias Current-Programming Input. Connect to internal voltage reference through a resistor to set bias current (see <i>Typical Operating Characteristics</i>). $I_{BIASOUT} = 40 \times (I_{BIASSET} + I_{BIASFB})$.
15	IMODSET	Laser Modulation Current-Programming Input. Connect to internal voltage reference through a resistor to set modulation current (see <i>Typical Operating Characteristics</i>). $I_{MOD} = 20 \times I_{MODSET}$.
16	IBIASOUT	Laser Bias Current Output. Connect to laser cathode through an R-L filter network (see the <i>Bias Network Compensation</i> section).
17, 19, 21	GNDA	Ground for Bias and Modulation Current Drivers
18	OUT-	Modulation Output. When VIN+ is high and VIN- is low, OUT- sinks I_{MOD} .
20	OUT+	Modulation Output. When VIN+ is low and VIN- is high, OUT+ sinks I_{MOD} .
22	VCCA	+5V Supply Voltage for Bias and Modulation Current Drivers. Connect VCCA to the same potential as VCCB, but provide separate bypassing for VCCA and VCCB.
23	IPIN	Monitor Photodiode Current Input. Connect IPIN to photodiode's anode.
24	SLWSTRT	Slow-Start Capacitor Input. Connect capacitor to ground or leave unconnected to set start-up time, $t_{STARTUP} = 25.4k\Omega (C_{SLWSTRT} + 2pF)$.

Single +5V, Fully Integrated, 155Mbps Laser Diode Driver

MAX3263

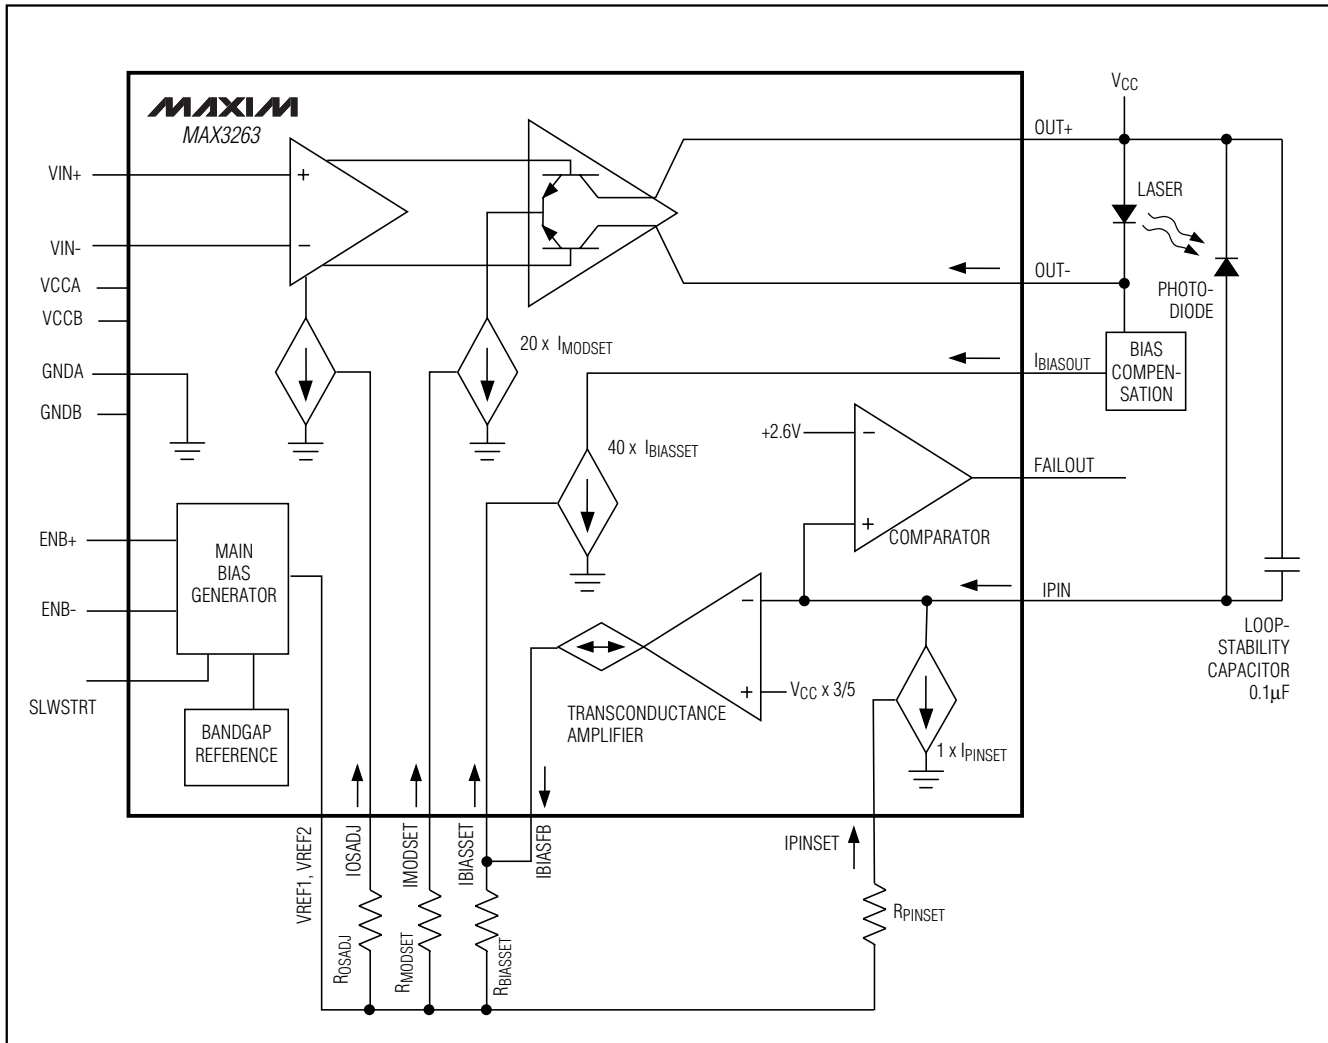

Figure 1. Functional Diagram

Detailed Description

The MAX3263 laser driver has three main sections: a reference generator with temperature compensation, a laser bias block with automatic power control, and a modulation driver (Figure 1).

The reference generator provides temperature-compensated biasing and a voltage-reference output. The voltage reference is used to program the current levels of the high-speed modulation driver, laser diode, and PIN (p+, intrinsic, n-) monitor diode.

The laser bias block sets the bias current in the laser diode and maintains it above the threshold current. A

current-controlled current source (current mirror) programs the bias, with I_BIASSET as the input. The mirror's gain is approximately 40 over the MAX3263's input range. Keep the output voltage of the bias stage above 2.2V to prevent saturation.

The modulation driver consists of a high-speed input buffer and a common-emitter differential output stage. The modulation current mirror sets the laser modulation current in the output stage. This current is switched between the OUT+ and OUT- ports of the laser driver. The modulation current mirror has a gain of approximately 20. Keep the voltages at OUT+ and OUT- above 2.2V to prevent saturation.

Single +5V, Fully Integrated, 155Mbps Laser Diode Driver

The overshoot mirror sets the bias in the input buffer stage (Figure 2). Reducing this current slows the input stage and reduces overshoot in the modulation signal. At the same time, the peak-to-peak output swing of the input buffer stage is reduced. Careful design must be used to ensure that the buffer stage can switch the output stage completely into the nonlinear region. The input swing required to completely switch the output stage depends on both ROSADJ and the modulation current. See Allowable ROSADJ Range vs. Modulation Current and Maximum Modulation Current vs. Minimum Differential Input Signal Amplitude graphs in the *Typical Operating Characteristics*. For the output stage, the width of the linear region is a function of the desired modulation current. Increasing the modulation current increases the linear region. Therefore, increases in the modulation current require larger output levels from the first stage.

Failure to ensure that the output stage switches completely results in a loss of modulation current (and extinction ratio). In addition, if the modulation port does not switch completely off, the modulation current will contribute to the bias current, and may complicate module assembly.

Automatic Power Control

The automatic power control (APC) feature allows an optical transmitter to maintain constant power, despite changes in laser efficiency with temperature or age. The APC requires the use of a monitor photodiode.

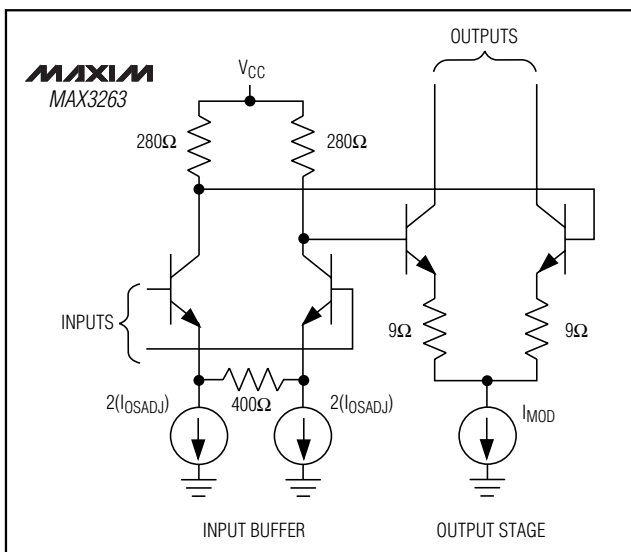

Figure 2. MAX3263 Modulation Driver (Simplified)

The APC circuit incorporates the laser diode, the monitor photodiode, the pin set current mirror, a transconductance amplifier, the bias set current mirror, and the laser fail comparator (Figure 1). Light produced by the laser diode generates an average current in the monitor photodiode. This current flows into the MAX3263's IPIN input. The IPINSET current mirror draws current away from the IPIN node. When the current into the IPIN node equals the current drawn away by IPINSET, the node voltage is set by the $V_{CC} \times 3/5$ reference of the transconductance amplifier. When the monitor current exceeds IPINSET, the IPIN node voltage will be forced higher. If the monitor current decreases, the IPIN node voltage is decreased. In either case, the voltage change is amplified by the transconductance amplifier, and results in a feedback current at the IBIASFB node. Under normal APC operation, IBIASFB is summed with IBIASSET, and the laser bias level is adjusted to maintain constant output power. This feedback process continues until the monitor-diode current equals IPINSET.

If the monitor-diode current is sufficiently less than IPINSET (i.e., the laser stops functioning), the voltage on the IPIN node drops below 2.6V. This triggers the failout comparator, which provides a TTL signal indicating laser failure. The FAILOUT output asserts only if the monitor-diode current is low, not in the reverse situation where the monitor current exceeds IPINSET. FAILOUT is an open-collector output that requires an external pull-up resistor of $2.7k\Omega$ to V_{CC} .

The transconductance amplifier can source or sink currents up to approximately 1mA. Since the laser bias generator has a gain of approximately 40, the APC function has a limit of approximately 40mA (up or down) from the initial set point. To take full advantage of this adjustment range, it may be prudent to program the laser bias current slightly higher than required for normal operation. However, do not exceed the IBIASOUT absolute maximum rating of 75mA.

To maintain APC loop stability, a $0.1\mu F$ bypass capacitor may be required across the photodiode. If the APC function is not used, disconnect the IBIASFB pin.

Enable Inputs

The MAX3263 provides complementary enable inputs (ENB+, ENB-). The laser is disabled by reducing the reference voltage outputs (VREF1, VREF2). Only one logic state enables laser operation (Figure 3 and Table 1).

0	1	On
1	0	Off
1	1	Off

Temperature Considerations

The MAX3263 output currents are programmed by current mirrors. These mirrors each have a $2V_{BE}$ temperature coefficient. The reference voltage (V_{REF}) is adjusted $2V_{BE}$ so these changes largely cancel, resulting in output currents that are very stable with respect to temperature (see *Typical Operating Characteristics*).

Design Procedure

Interfacing Suggestions

Use high-frequency design techniques for the board layout of the MAX3263 laser driver. Adding some damping resistance in series with the laser raises the load impedance and helps reduce power consumption (see *Reducing Power Consumption* section). Minimize any series inductance to the laser, and place a bypass capacitor as close to the laser's anode as possible.

Power connections labeled VCCA are used to supply the laser modulation and laser bias circuits. VCCB connections supply the bias-generator and automatic-power

control circuits. For optimum operation, isolate these supplies from each other by independent bypass filtering.

GND_A and GND_B have multiple pins. Connect all pins to optimize the MAX3263's high-frequency performance. Ground connections between signal lines (V_{IN+} , V_{IN-} , $OUT+$, $OUT-$) improve the quality of the signal path by reducing the impedance of the interconnect. Multiple connections, in general, reduce inductance in the signal path and improve the high-speed signal quality. GND pins should be tied to the ground plane with short runs and multiple vias. Avoid ground loops, since they are a source of high-frequency interference.

The MAX3263 data inputs accept PECL input signals, which require 50Ω termination to ($V_{CC} - 2V$). Figure 4 shows alternative termination techniques. When a termination voltage is not available, use the Thevenin-equivalent termination. When interfacing with a non-PECL signal source, use one of the other alternative termination methods shown in Figure 4.

Bias Network Compensation

For best laser transmitter performance, add a filter to the circuit. Most laser packages (TO-46 or DIL) have a significant amount of package inductance (4nH to 20nH), which limits their usable data rate. The MAX3263 OUT pin has about 1pF of capacitance. These two parasitic components can cause high-frequency ringing and aberrations on the output signal.

If ringing is present on the transmitter output, try adding a shunt RC filter to the laser cathode. This limits the bandwidth of the transmitter to usable levels and reduces ringing dramatically (Figure 5).

- L = Laser inductance
- C = Shunt filter capacitance
- R = Shunt filter resistance

A good starting point is $R = 25\Omega$ and $C = L / 4R$. Increase C until aberrations are reduced.

The IBIASOUT pin has about 4pF of parasitic capacitance. When operating at bias levels over 50mA, the impedance of the bias output may be low enough to decrease the rise time of the transmitter. If this occurs, the impedance of the IBIASOUT pin can be increased by adding a large inductor in series with the pin.

Reducing Power Consumption

The laser driver typically consumes 40mA of current for internal functions. Typical load currents, such as 12mA of modulation current and 20mA of bias current, bring the total current requirement to 72mA. If this were dissipated entirely in the laser driver, it would generate 360mW of

Single +5V, Fully Integrated, 155Mbps Laser Diode Driver

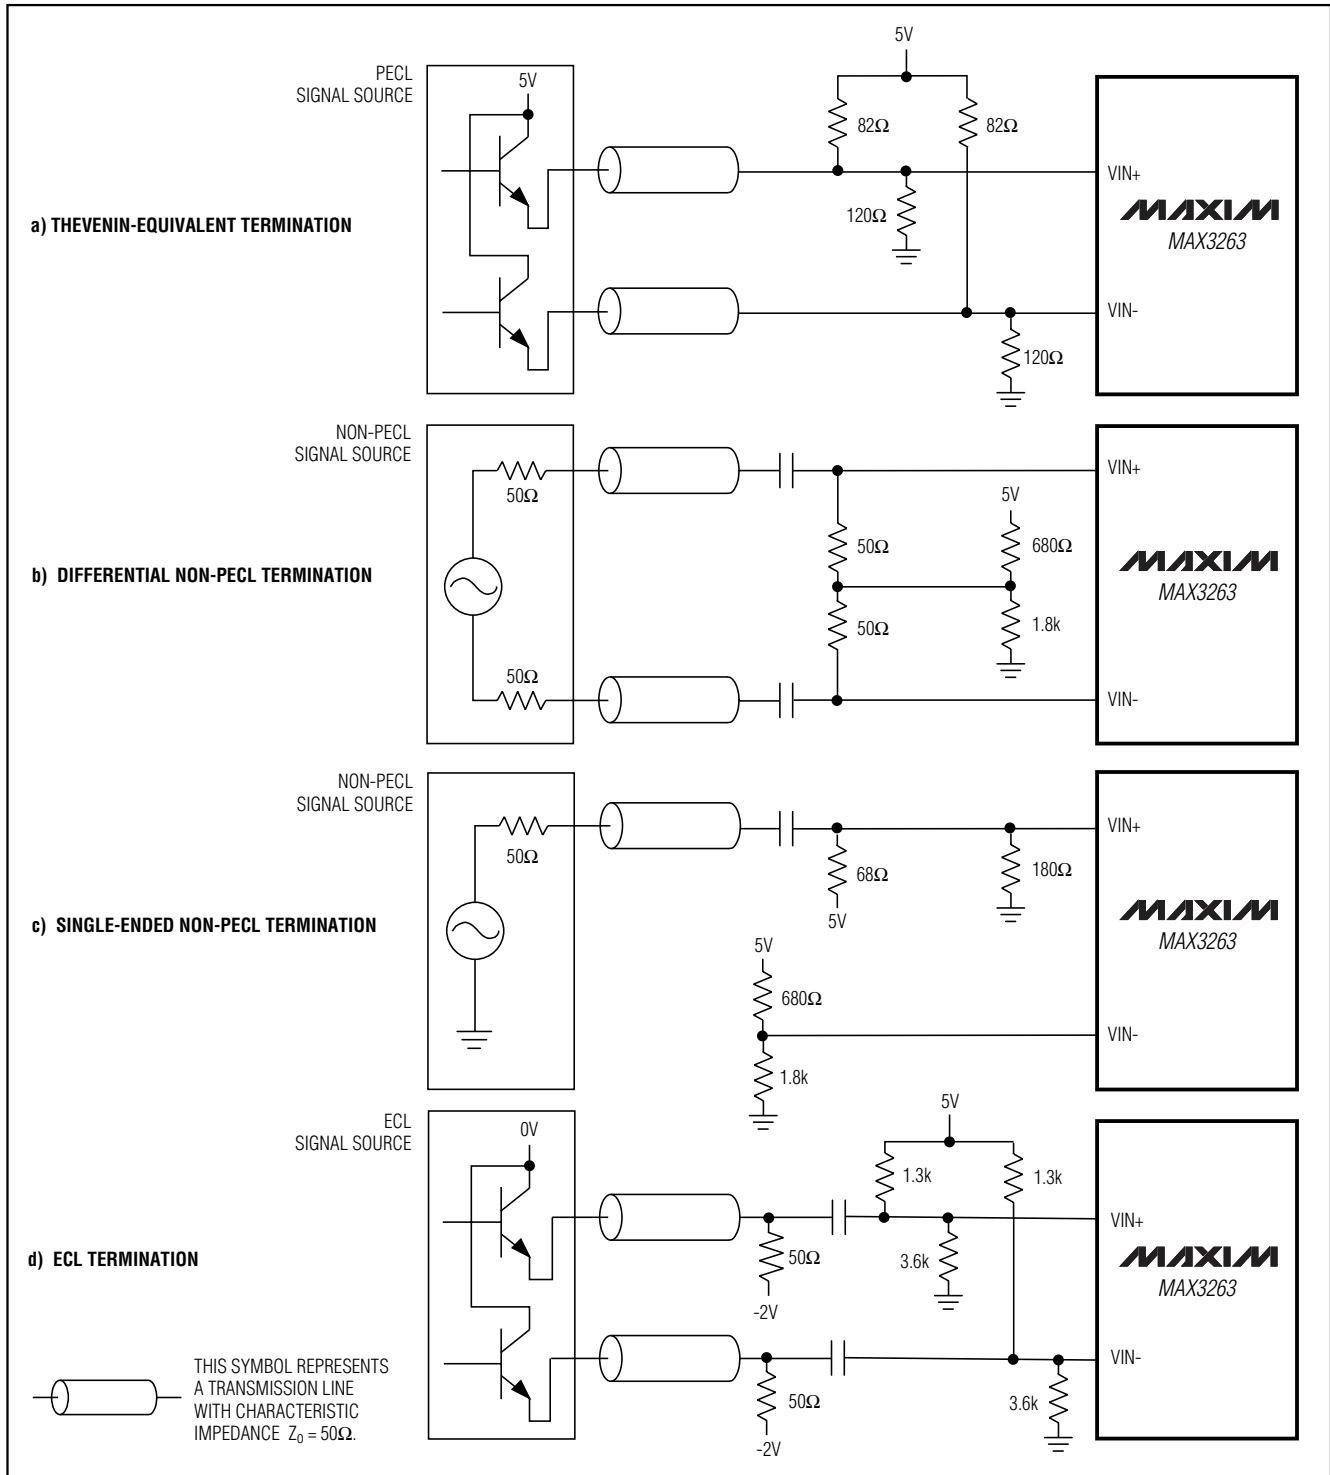

Figure 4. Alternative PECL Data-Input Terminations

Single +5V, Fully Integrated, 155Mbps Laser Diode Driver

MAX3263

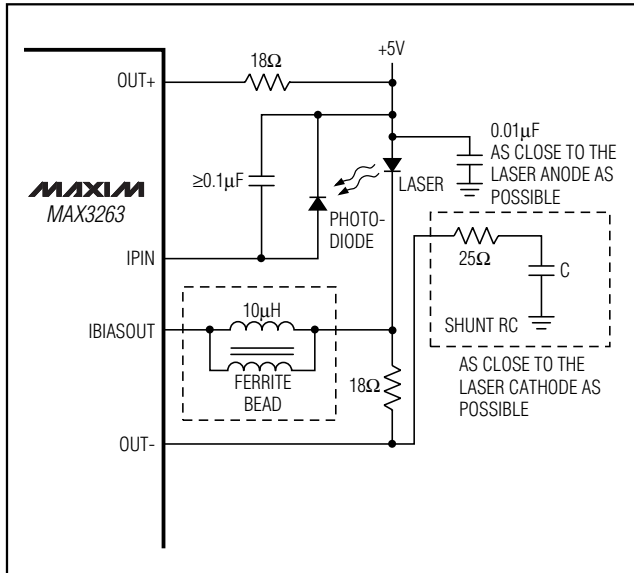

Figure 5. Typical Laser Interface with Bias Compensation

heat. Fortunately, a substantial portion of this power is dissipated across the laser diode. A typical laser diode drops approximately 1.6V when forward biased. This leaves 3.4V at the MAX3263's OUT- terminal. It is safe to reduce the output terminal voltage even further with a series damping resistor. Terminal voltage levels down to 2.2V can be used without degrading the laser driver's high-frequency performance. Power dissipation can be further reduced by adding a series resistor on the laser driver's OUT+ side. Select the series resistor so the OUT+ terminal voltage does not drop below 2.2V with the maximum modulation current.

Applications Information

Programming the MAX3263 Laser Driver

Programming the MAX3263 is best explained by an example. Assume the following laser diode characteristics:

Wavelength	λ	1300nm
Threshold Current	I_{TH}	20mA at +25°C(+0.35mA/°C temperature variation)
Monitor Responsivity	ρ_{mon}	0.1A/W (monitor current / average optical power into the fiber)
Modulation Efficiency	η	0.1mW/mA (worst case)

Now assume the communications system has the following requirements:

Average Power	P_{AVE}	0dBm (1mW)
Extinction Ratio	E_r	6dB ($E_r = 4$)
Temperature Range	T_r	0°C to +70°C

1) Determine the value of I_{PINSET} :

The desired monitor-diode current is $(P_{AVE})(\rho_{mon}) = (1mW)(0.1A/W) = 100\mu A$. The R_{PINSET} vs. Monitor Current graph in the *Typical Operating Characteristics* show that R_{PINSET} should be 18k Ω .

2) Determine R_{MODSET} :

The average power is defined as $(P_1 + P_0) / 2$, where P_1 is the average amplitude of a transmitted "one" and P_0 is the average amplitude of a transmitted "zero." The extinction ratio is P_1/P_0 . Combining these equations results in $P_1 = (2 \times P_{AVE} \times E_r) / (E_r + 1)$ and $P_0 = (2 \times P_{AVE}) / (E_r + 1)$. In this example, $P_1 = 1.6mW$ and $P_0 = 0.4mW$. The optical modulation is 1.2mW. The modulation current required to produce this output is $1.2mW / \eta = (1.2mW) / (0.1mA/mW) = 12mA$. The *Typical Operating Characteristics* show that $R_{MODSET} = 3.9k\Omega$ yields the desired modulation current.

3) Determine the value of R_{OSADJ} :

Using the Allowable R_{OSADJ} Range vs. Modulation Current graph in the *Typical Operating Characteristics*, a 5.6k Ω resistor is chosen for 12mA of modulation current. The maximum R_{OSADJ} values given in the graph minimize aberrations in the waveform and ensure that the driver stage operates fully limited.

4) Determine the value of $R_{BIASSET}$:

The automatic power control circuit can adjust the bias current 40mA from the initial setpoint. This feature makes the laser driver circuit reasonably insensitive to variations of laser threshold from lot to lot. The bias setting can be determined using one of two methods:

- A) Set the bias at the laser threshold.
- B) Set the bias at the midpoint of the highest and lowest expected threshold values.

Method A is straightforward. In the second method, it is assumed that the laser threshold will increase with age. The lowest threshold current occurs at 0°C when the laser is new. The highest threshold current occurs at +70°C at the end of the product's life. Assume the laser is near the end of life when its threshold reaches two-times its original value.

Lowest Bias Current:

$$I_{TH} + \Delta I_{TH} = 20mA + (0.35mA/°C)(-25°C) = 11.25mA$$

Highest Bias Current:

$$2 \times I_{TH} + \Delta I_{TH} = 40mA + (0.35mA/°C)(+45°C) = 55.8mA$$

Single +5V, Fully Integrated, 155Mbps Laser Diode Driver

In this case, set the initial bias value to 34mA (which is the midpoint of the two extremes). The 40mA adjustment range of the MAX3263 maintains the average laser power at either extreme.

The *Typical Operating Characteristics* show that $R_{BIASSET} = 1.8k\Omega$ delivers the required bias current.

Laser Safety and IEC 825

Using the MAX3263 laser driver alone does not ensure that a transmitter design is compliant with IEC 825 safety requirements. The entire transmitter circuit and component selections must be considered. Each customer

must determine the level of fault tolerance required by their application, recognizing that Maxim products are not designed or authorized for use as components in systems intended for surgical implant into the body, for applications intended to support or sustain life, or for any other application where the failure of a Maxim product could create a situation where personal injury or death may occur.
